PLANTS

CARNIVOROUS PLANT TERRARIUM INSTRUCTIONS

A terrarium makes a lovely display for your carnivorous plants and creates a micro climate as well, which is a perfect way to keep your plants in.

Follow these 9 simple steps to create a stunning terrarium:

1

Start with putting a 1-2 cm. layer of the grit provided in your vase or bowl and tap it.

2

Put some dried sphagnum moss on top of the grit, also a layer of 1-2 cm.

3

Add the special carnivorous plant compost on the sphagnum and keep it light.

4

Now you can add your plant(s) by making (a) small hole(s) in the compost. Take off remaining compost from the plant, but be gentle with the roots.

5

Add some pine bark (this is only provided with *Nepenthes* and *Cephalotus*).

6

Water with rainwater or distilled water and place the terrarium in a bright position, but not in direct sun.

7

If you have bought a dome, then remove it for a while from time to time to keep the plants ventilated and to give the carnivorous plants the ability to catch insects.

8

To make sure your carnivorous plants have enough food, you can always hand feed them with live or dried insects.

9

Re-pot as soon as plants are growing too big for the terrarium. Always use special carnivorous plant compost.
